This work is included inside the project “La entonación interrogativa y declarativa del español de Canarias y su relación con la de Cuba y Venezuela” (FFI2010-16993) tied to the macro-project AMPER (*Atlas Multimedia de Prosodia del Espacio Románico*). The objective is the study of interrogative intonation in comparison between Cuba and Canary Islands produced in a spontaneous style by men and women from the two meridional varieties. It is conceived as a pilot study that will give way to a systematic comparative work inside the reference project. What we pretend is to find out if intonation patterns of both varieties match in the fundamental, as in how we established in our initial hypothesis. On the other hand, the relevance of the comparison radicates in that we apply for the first time a common methodology, as in, the established by AMPER, which will allow us to establish the relationship between the analyzed patterns upon a same basis, which is fundamental, not only to relate the two analyzed varieties, but also because studies of this kind contribute to begin determining the intonational characteristics of a romanic language such as Spanish above other romanic languages.
